/note="Corgan: brain; Vector: pXX-Asc; Site_1: EcoR I;
/note="Corgan: brain; Vector: pXX-Asc; Site_1: EcoR I;
Site_2: Not I; The library was constructed according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNa was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then
cloned directionally into pXX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
/s GTGGTGGAA. This library was created for the
University of Towa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Instututes of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RATADCYB

Ratus norvegicus adenylyl cyclase type VI mRNA, complete cds.
M96160.
M96160.1 GI:202718

adenylate cyclase; adenylyl cyclase type VI.
Ratus norvegicus (strain Sprague-Dawley) adult liver, kidney, heart cDNA to mRNA.
Ratus norvegicus
Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae;

                                                                                                                                                                                                                                                                      The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytcyclases (also referred as adenylocyclase, receptors (per AR), adenylytcyclases) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (AVVI) isofform which is used for generating a third beta-ASP transgene, used in the exemplification
                                                                                                                                              Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure
                                                                                                                                                                                                                                       English

                                                                                                                                                                                                                                                enhancing
                                                                                                                                                                                                                                          The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inscrting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclases, edenylate cyclases and cAMP synthetase) and G-protein receptor kinase (GRX) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This DNA sequence encodes human type VI adenylyl cyclase (hAC6, see AAW30599) that is expressed mainly in the heart and brain. hAc6 has a similar putative structure to other adenylyl cyclase isoforms to a similar putative structure to other adenylyl cyclase isoforms but, like type V, is distinguishable in that it has a larger N-terminus and a relatively shorter C-terminus as it lacks the C2b region. hAc6 cDNA was initially isolated from a human heart cDNA library using an adenylyl cyclase PCR fragment as probe. It was used to design primers that were used in a PCR-based RACE to obtain the full-length cDNA sequence. The invention relates to the hAC6 cape, methods for the recombinant production of purified hAc6 and the proteins made by these methods, antibodies against hAC6, vectors, probes and host cells (especially HEK-293) transformed by dense encoding polypeptides having hAC6 activity, along with diagnostic and therapeutic uses for these various reagents. hAC6 can be used as a tool to screen for agonists and antagonists that stimulate/inhibit hAC6. Such compounds have therapeutic utility
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Newly isolated and purified human type VI adenylyl cyclase (hAC6) bolypeptide - useful for identifying potential therapeutic agents that modulate hAC6 activity, and for the diagnosis of hAC6-associated diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            can be used as a tool to screen for agonists and antagonists that stimulate/inhibit hAC6. Such compounds have therapeutic utility in freating diseases caused by aberrant activity of this enzyme, and diseases whose symptoms can be ameliorated by stimulating or inhibiting the activity of hAC6.

The beta-AsPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present consequence encodes human modified cardiac adenylcyclase VI (ACVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure -

One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into pUC18 and further subcloned and sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete

canine cardiac adenylyl cyclase gene. The gene is suspected of being involved in the regulation of cardiac function and it is thought that decreased activity of adenylyl cyclase in the heart may be a major factor in the development of heart failure. Thus the adenylyl cyclase gene is useful to screen cpds. which stimulate the activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

The present invention describes a method for examining ischaemic

```
5
         genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in AB857020 to AB857374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                 155
                                                                                                                                                                                                                                                                                                                                                             180
